thor_cthip1.0_release	0 0 2 3 * Asia/Kolkata	NPD_Scheduled_Pipeline	✓ Passed	in 10 months	
thor_cthip2.0_release	0 0 3 3 * Asia/Kolkata	NPD_Scheduled_Pipeline	✓ Passed	in 10 months	
thor_cthip_master	54 21 * * * Asia/Kolkata	NPD_Scheduled_Pipeline	✗ Failed	in 1 hour	

Pipeline Summary with Purpose:

- 1) **sonar_thor_cthip2.0_release** :Performs automated **SonarQube code quality and security analysis** for the Thor CTHip 2.0 release pipeline. Ensures code meets quality gates before release.
- 2) **sonar_thor_cknee2.0_release** → Executes **SonarQube validation for CKnee 2.0 release**, focusing on code quality, bugs, and vulnerabilities. Actively scheduled pipeline ensuring compliance before production deployments.
- 3) **engineering_pipeline** → Generic **engineering orchestration pipeline** used for internal builds, validations, or ad-hoc execution. Acts as a utility pipeline but currently inactive with no upcoming scheduled runs.
- 4) **thor_ctknee_master** Runs **scheduled builds and validations for Thor CTKnee master branch** using dynamic pipeline generation. Uses orchestrate + trigger mechanism; currently active but last run failed, requiring attention.
- 5) **thor_cknee2.0_release** → Handles **release build orchestration for CKnee 2.0**, including pipeline generation and execution. Designed for controlled release workflows.
- 6) **thor_cthip1.0_release** → Manages **scheduled release builds for Thor CTHip 1.0**, including artifact generation and validation.

Configured for long-interval execution, indicating maintenance or legacy release.

- 7) **thor_cthip2.0_release** → Executes **release pipeline for Thor CTHip 2.0**, including build orchestration and artifact publishing.
Runs infrequently, indicating controlled or milestone-based release scheduling.
- 8) **thor_cthip_master** → Runs **master branch CI pipeline for Thor CTHip**, including dynamic pipeline creation and build execution.
Highly active pipeline; last run failed and needs investigation to maintain CI stability.

2) Below is Thor-Windows Pipeline:

[strykercorp / IMT / Navigation / Thor-Windows · GitLab](#)

This pipeline automates the **end-to-end build, validation, and packaging** of Thor (Hip/Knee) applications by:

- Code checkout from **Perforce**
- Build execution using **Docker & docker-compose**
- Support for **multiple products (CTHip, CTKnee, Knee1.0)**
- Optional **SonarQube quality checks**
- Generating **installable artifacts (install-root)**
- Packaging and uploading deliverables to **Artifactory**
- Cleanup and environment reset after execution, Cleaning up resources (Perforce clients, containers)

3) Below is IMT:hipplanning Pipeline:

[strykercorp / IMT / HipPlanning · GitLab](#)

This pipeline automates the **end-to-end CI/CD process for Hip Planning**, including:

- Code validation & version checks
- Build, test, and **SonarCloud-based code quality analysis with Quality Gate enforcement**
- Continuous monitoring of **code reliability, security, maintainability, coverage, and duplication metrics**
- Documentation generation (API + SDD)

- Deployment to **cloud** and **on-prem** repositories.

4) Below is cthip1.0 Pipeline:

[strykercorp / IMT / Navigation / Cthip1.0 · GitLab](#)

This pipeline orchestrates the **secure build, validation, and artifact handling** for the CT Hip application by:

- Fetching source code from **Perforce streams**
- Supporting both **Windows and Linux** build flows
- Integrating **security scanning (Synopsys Detect / Black Duck)**
- Generating and retrieving build artifacts from **Artifactory**
- Enabling **controlled execution via rules (MR, branches, CI triggers)** .
